

SAME SYMPTOM · DIFFERENT CAUSE

The Eyes Again

The same late pictures. The repair may not match.

The objective stays without usable pictures even though position is still updating.

THE SITUATION

An aircraft is on task. Position updates and the path that carries video are inside the limits they already met. Pictures have been usable.

WHAT THE OPERATOR SEES

Position stays current. The pictures become unusable. The screen matches The Eyes.

WHY THIS IS HARD

The same frozen feed can come from a crowded path or from a producer that has stopped. The owners and the repairs are not the same. Changing the path, or slowing other traffic, should not count unless the pictures themselves return.

SEEN

Position fresh, video dead

OPEN QUESTION

Producer or path

>

AT RISK

Objective stays blind

WHAT V8Y MUST DETERMINE

V8Y must distinguish a stopped producer from a crowded path and from a fading link, without treating those repairs as interchangeable.

The objective stays without pictures until that distinction is made and the right repair lands.

WHAT COUNTS AS RECOVERY

Success is not a path change. Success is that usable frames return while the path stays inside the limits it already met.

WHAT THIS DEMONSTRATES

- Same symptom as a crowded path.
- Producer, path, and competing use kept apart.
- Not presented as a reconstructed combat incident.
- Recovery judged on frames, with the path still in limits.

OPERATIONAL BASIS

A synthetic demonstration. A stopped producer and a crowded or fading link can look the same on this screen. It is not a reconstructed combat incident.

Compare with The Eyes. Quiet Payload and Silent Instrument ask this question in other settings.

Request this demonstration

V8Y. Observe the connected system. Prove recovery at the mission edge.
